混响时间计算

学习目标

计算房间混响时间,至少设计2种房间进行计算.

实验设置

使用 RIR-Generator 生成2个房间的 rir, 幅度的平方的后向积分,得到edc曲线,观察混响时间与设定时间是否一致。

代码

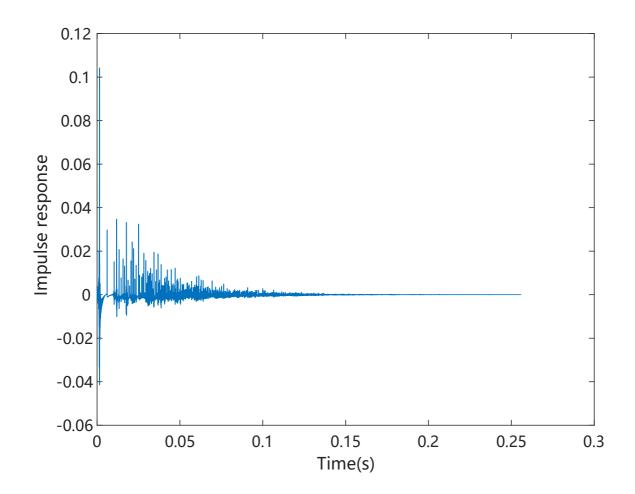

全部代码及测试数据: https://github.com/RRRRwys/dasp-homework

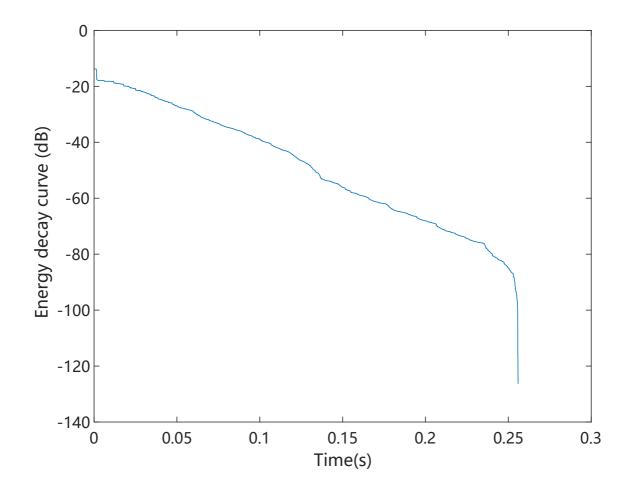

```
1 clear; close all; clc;
 2 c = 340;
3 fs = 16000;
4 r = [2 1.5 2];
5 s = [2 2 2];
6 \% L = [5 4 3];
7 L = [10 5 5];
8 \text{ beta} = 0.25;
                           % 混响时间
9 n = 4096;
10 h = rir_generator(c, fs, r, s, L, beta, n);
11
12 t = [0:length(h)-1]./fs;
13 figure(1);
14 plot(t,h);
15 xlabel('Time(s)');
16 ylabel('Impulse response');
17
18 % 计算 edc
19 edc = zeros(1,length(h));
20 for i = [length(h)-1:-1:1]
       edc(i) = edc(i+1) + h(i) * h(i);
21
22
   end
```

```
23  edc = 10 * log10(edc);
24  figure(2);
25  plot(t,edc);
26  xlabel('Time(s)');
27  ylabel('Energy decay curve (dB)');
```

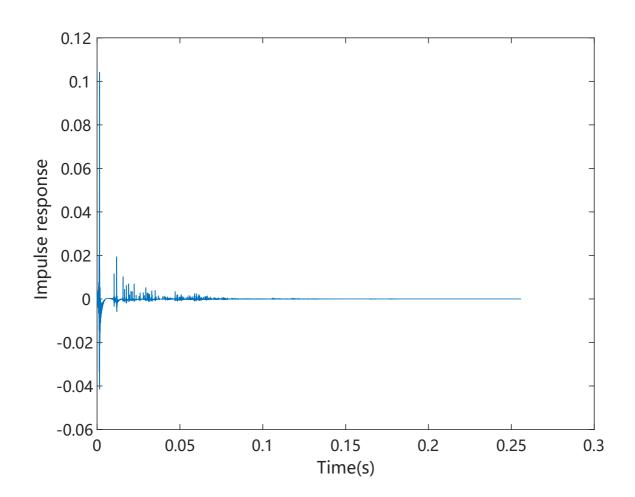

实验结果

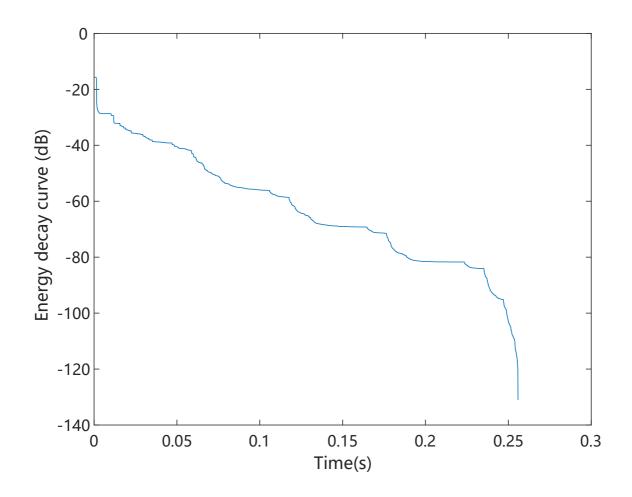

room1: 5m, 4m, 3m

room2: 10m 5m 5m

观察可以发现混响时间与设定值基本一致
